IN THE CLAIMS

1. (Previously presented) A method of positioning a tubular in a borehole, comprising:

delivering the tubular into the borehole;

positioning the tubular in the borehole, after said delivering, in a manner that leaves an annular space around it; and

expanding the tubular.

2. (Original) The method of claim **1**, comprising:

providing a plurality of openings in said tubular;

disposing an extendable member in each said opening.

3. (Original) The method of claim **2**, comprising:

keeping said extendable members substantially within said tubular for run in.

4. (Original) The method of claim **2**, comprising:

providing a closed end on at least one of said extendable members wherein said closed end is selectively driven toward the borehole wall.

5. (Original) The method of claim **2**, comprising:

providing an open end on at least one of said extendable members wherein said open end is selectively driven toward the borehole wall.

6. (Original) The method of claim **2**, comprising:

driving at least one of said extendable members toward the borehole wall with said expansion.

7. (Original) The method of claim **2**, comprising:

driving at least one of said extendable members toward the borehole wall prior to said expansion.

8. (Original) The method of claim **7**, comprising:

locking at least one of said extendable members against collapse after said driving.

9. (Previously presented) The method of claim **2**, comprising:

penetrating the borehole wall with at least one of said extendable members.

10. (Original) The method of claim **9**, comprising:

providing an open leading end on at least one of said extendable members to facilitate said penetrating.

11. (Original) The method of claim **7**, comprising:

using internal pressure for said driving.

12. (Original) The method of claim **7**, comprising:

using mechanical force for said driving.

13. (Original) The method of claim **3**, comprising:

allowing said extendable members to extend no further than an upset or a coupling at a joint on said tubular prior to extending.

14. (Original) The method of claim **1**, comprising:

expanding said tubular with a swage.

15. (Original) The method of claim **1**, comprising:

expanding said tubular with internal pressure.

16. (Previously presented)

A method of positioning a tubular in a borehole, comprising:

delivering the tubular into the borehole;

positioning the tubular in the borehole in a manner that leaves an annular space around it; and

expanding the tubular;

providing a plurality of openings in said tubular;

disposing an extendable member in each said opening;

driving at least one of said extendable members toward the borehole wall prior to said expansion;

using internal pressure for said driving;

delivering a sealing material under pressure through said tubular;

accomplishing said driving with said pressurized sealing material in said tubular;

delivering the sealing material to said annular space.

17. (Original) The method of claim **16**, comprising:

expanding the tubular before the sealing material sets up.

18. (Original) The method of claim **2**, comprising:

delivering a sealing material under pressure through said tubular;

delivering the sealing material to said annular space;

expanding the tubular before the sealing material sets up.

19. (Original) The method of claim **18**, comprising:

providing an open end and a closed end on at least one of said extendable members.

20. (Original) The method of claim **19**, comprising:

driving one of said ends into the borehole with at least one of applied pressure or force from within the tubular and physical expansion of the tubular.
